

What is claimed is:

1. A device for cooling electric equipments of hooded microwave oven, comprising:  
a ventilation motor assembly mounted on the top of a cavity, for forming both a  
5 flow of air for a hood function and a flow of air for dissipating heat from said electric equipments; and  
a suction grill which is a passage through which outer air is sucked to the top of  
said cavity by suction force of said ventilation motor assembly,  
wherein said electric equipments are positioned in a flow path of said air that is  
10 sucked through said suction grill and flows to said ventilation motor assembly.
2. The device as claimed in Claim 1, wherein a bottom plate for defining a bottom  
surface of an electric equipment installation chamber, in which said electric equipments  
are mounted, is mounted at a top end of said cavity, whereby said electric equipments are  
15 positioned in said flow path of said air flowing from said suction grill to said ventilation  
motor assembly.
3. The device as claimed in Claim 2, wherein a magnetron of said electric  
equipments is mounted on a side surface of said cavity; a passage hole for guiding said air  
to said magnetron is formed on said bottom plate; and said air that has passed by said  
20 magnetron is guided to said ventilation motor assembly by an air guide.
4. The device as claimed in Claim 2, wherein a magnetron of said electric  
equipments is mounted on said bottom plate and adjacent to an inlet of said ventilation  
25 motor assembly.
5. The device as claimed in Claim 4, wherein a wave-guide for guiding a microwave  
generated by said magnetron to the interior of said cavity is mounted on a bottom surface  
of said magnetron and on said side surface of said cavity.
